

Manual Testing Assessment

Q1 | You have a shoe-selling e-commerce platform. Now, the client wants to implement a new feature, "Search". During the client meeting, they mentioned they wanted to make the search dynamic, with any keywords or specific text. Now you have a chance to get into more details on the feature. You can ask the client up to 10 questions. List the questions according to priority.

Answer:

Priority Questions

1. Do you want search to work only on product names, or also on things like category, brand, size, color, and descriptions?
2. Should it only match exact words, or also handle partial matches, spelling mistakes, and similar words?
3. Do you want users to refine search results with filters (e.g., price range, size, color, brand, discount)?
4. Do you want sorting options like relevance, lowest price first, newest products, or most popular?
5. Should we show auto-suggestions, "did you mean" corrections, or trending searches while the user types?
6. Should results appear instantly as users type, or only after they hit Enter?
7. Should it search directly in the database, or do you prefer using a dedicated search engine like Elasticsearch or Algolia?
8. Should results change based on each user's past activity, preferences, or location?
9. For mobile, do you want features like voice search, predictive text, or recent search history on mobile?
10. Should we track things like popular keywords, searches with no results, and what people click on?

Q2| Write down the test cases according to your questions.

Answer

Each test case will include: **Test Case ID, Test Scenario, Steps, Expected Result.**

Test Cases for Search Feature

1. Search Scope

- **TC-01:** Search by product title
 - Steps: Search “Nike Air Max”
 - Expected: All products with “Nike Air Max” in the title appear.
 - **TC-02:** Search by brand
 - Steps: Search “Adidas”
 - Expected: All Adidas shoes appear.
 - **TC-03:** Search by category
 - Steps: Search “Running Shoes”
 - Expected: All shoes under running category appear.
 - **TC-04:** Search by attributes
 - Steps: Search “Red Size 9”
 - Expected: Only red shoes of size 9 appear.
-

2. Search Type

- **TC-05:** Exact match
 - Steps: Search “Puma Sport”
 - Expected: Results only with exact text “Puma Sport”.
- **TC-06:** Partial match

- Steps: Search “Pum”
 - Expected: Suggestions/results with “Puma” appear.
 - **TC-07: Misspelling**
 - Steps: Search “Nik Air”
 - Expected: System suggests “Nike Air” or shows closest match.
 - **TC-08: Synonyms/Fuzzy search**
 - Steps: Search “Sneakers”
 - Expected: Results show shoes tagged as “Sneakers” and “Trainers”.
-

3. Filters

- **TC-09: Apply price filter**
 - Steps: Search “Nike” → Filter by \$50–\$100
 - Expected: Only Nike shoes within \$50–\$100 range shown.
 - **TC-10: Apply multiple filters**
 - Steps: Search “Adidas” → Filter by Size 9 + Color Black
 - Expected: Only Adidas black shoes in size 9 appear.
-

4. Sorting Options

- **TC-11: Sort by price low-to-high**
 - Steps: Search “Running Shoes” → Sort by lowest price
 - Expected: Results arranged by price ascending.
 - **TC-12: Sort by newest arrivals**
 - Steps: Search “Boots” → Sort by newest
 - Expected: Latest added products appear first.
-

5. Search Suggestions

- **TC-13:** Auto-suggestions
 - Steps: Type “Nik” in search bar
 - Expected: Suggestions like “Nike Air”, “Nike Shoes” appear.
 - **TC-14:** Did you mean correction
 - Steps: Type “Adidass”
 - Expected: “Did you mean Adidas?” shown.
-

6. Performance

- **TC-15:** Real-time results
 - Steps: Type each letter of “Puma”
 - Expected: Results update with every keystroke.
 - **TC-16:** Enter key search
 - Steps: Type “Reebok” → Press Enter
 - Expected: Results load after pressing Enter.
-

7. Data Source & Indexing

- **TC-17:** Database query works
 - Steps: Search “Converse”
 - Expected: Data fetched directly from DB without error.
 - **TC-18:** Search engine indexing works
 - Steps: Add new product → Search product name
 - Expected: Product appears after indexing refresh.
-

8. Personalization

- **TC-19:** Personalized results
 - Steps: User frequently searches “Sneakers” → Search again

- Expected: Sneakers appear at top of results.
 - **TC-20:** Location-based results
 - Steps: User from Bangladesh searches “Sandals”
 - Expected: Shows sandals available in BD stock.
-

9. Mobile Optimization

- **TC-21:** Mobile predictive text
 - Steps: On mobile, type “N”
 - Expected: Suggestions like “Nike” appear.
 - **TC-22:** Voice search
 - Steps: Use voice search to say “Reebok Shoes”
 - Expected: Correct products shown.
-

10. Analytics & Tracking

- **TC-23:** Popular searches tracked
 - Steps: 50 users search “Nike”
 - Expected: “Nike” appears in trending searches.
 - **TC-24:** Zero-result query tracked
 - Steps: Search “XYZ Brand” (non-existing)
 - Expected: System logs this as zero-result query.
-

Q| Let's say, your development team implemented the feature on the Evershop site (<https://demo.evershop.io/>). Now execute your test case in the URL and generate a report.

⇒ **File provide in this drive link**

Q| Now there is a happy path journey for searching with the text "Nike react". For the first items on the list, add a couple of small/medium/large-sized black/white/green/red products to your cart. Then verify the Cart. Now execute the journeys from both the API and UI. Now provide feedback on your test analysis, and keep logs of the defects.
